1985 INDIANA VITAL STATISTICS

Indiana State Board of Health
1330 West Michigan Street, P.O. Box 1964, Indianapolis, IN 46206-1964

INDIANA VITAL STATISTICS SUMMARY

1985

For the first time in five years, Indiana resident births were up in 1985 (80,928), for a rate of 14.7 per 1000 population. This figure remained well below the estimated national rate of 15.7. The death total (48,173) was also up, and the death rate of 8.8 per 1000 population was just above the preliminary national figure of 8.7.

The fertility rate (births per 1000 females 15 through 44) rose slightly to 61.9 but remained far below the national figure of 66.1. The total fertility rate (lifetime births per 1000 women if current age-specific fertility rates prevailed for the entire reproductive period) was up to 1,716 but well below the figure of 2,100 necessary to maintain a stable population over an extended period.

There were 15,174 reported abortions in 1985, just below the figure for the previous year. The abortion ratio was 187.5 per 1000 live births.

The maternal death rate was 6.2 per 100,000 live births (five deaths). There were 886 infant deaths for a rate of 10.9 per 1000 live births. Both the number and rate were up from 1984, and the rate was above the U.S. estimate of 10.6.

Marriages (51,063) were down sharply for a rate of 9.3 per 1000 population, far below the national figure of 10.2.

The State's population remained virtually unchanged from 1984 (5,499,100).

Except for a switch in positions between Chronic Obstructive Pulmonary Disease and Diseases of the Arteries, the 10 leading causes of death were unchanged from 1984:

Causes	Deaths 1985	Deaths 1984
Diseases of the Heart	17,762	17,850
Cancer	10,903	10,805
Cerebrovascular Disease (Stroke)	4,145	4,061
Chronic Obstructive Pulmonary Disease	1,395	1,193
Diseases of the Arteries	1,273	1,349
Pneumonia	1,255	1,096
Motor Vehicle Accidents	1,066	981
Diabetes Mellitus	1,024	977
Accidents (exc. Motor Vehicle)	931	949
Suicide	650	654
	40,404	39,915

The leading causes accounted for 83.9 percent of all deaths, compared with 84.5 percent for 1984. Six of the 10 leading causes (Cancer, Stroke, Chronic Obstructive Pulmonary Disease, Pneumonia, Motor Vehicle Accidents, and Diabetes) each accounted for more deaths in 1985 than 1984.

INDIANA BEHAVIORAL RISK FACTOR SURVEILLANCE SURVEY

The Indiana Behavioral Risk Factor Surveillance System is an ongoing project funded by the Centers for Disease Control (CDC) since 1984. This project has evolved from earlier efforts of the CDC (1981-1983) to assist states in collecting health risk prevalence information that is associated with adverse health outcomes using a standardized questionnaire developed by the CDC. A technique known as the Joseph Waksberg's three-stage cluster design for random digit dialing is used to select a household to be included in the survey. From each household, an individual over 18 years of age is chosen randomly to be interviewed over the telephone about his/her health habits.

In the year 1985, 1,182 adult Indiana residents were interviewed. A criteria of 95 percent confidence interval level with an estimated precision of plus or minus 5 percent was employed to consider the adequacy of sample size. Thus, the estimate ascertained from the survey is expected to be within five percent of the true prevalence of each risk factor for the entire population in Indiana. The risk factors surveyed were cigarette smoking, hypertension, acute and chronic alcohol use, driving under the influence of alcohol, seat-belt use, physical activity, and weight. The results presented here were statistically weighted to reflect the actual proportion of adult Indiana residents according to sex and age group based on the 1980 U.S. Census.

SEAT-BELT USAGE

Use of seat belts when traveling in an automobile has been shown to decrease the risk of premature death and disability in motor vehicle accidents. Motor vehicle accidents was the eighth leading cause of death for adults in Indiana.

In 1985, approximately 30.3 percent of Indiana's adult population reported wearing their seat belts all the time. This means over two thirds of Indiana's adult population was at risk for premature death or disability. More men (72.1%) than women (66.5%) fall in this category.

Motor vehicle accidents was the leading cause of death for those in the 18-24 and 25-34 age group categories. Thus, 73.1 percent and 70.3 percent of the people in the above age groups, respectively, were at risk for premature death and disability due to the lack of seat-belt usage.

HYPERTENSION

Using the National Heart, Lung and Blood Institute's definition of "current hypertensives," approximately 20.4 percent of Indiana's adult population were found to be hypertensives. Of these, 39.7 percent were men and 60.3 percent were women. Hypertension is associated with heart disease, stroke, and diseases of the arteries.

SEDENTARY LIFE-STYLE

A sedentary life-style is defined as any activity done for less than 20 minutes or less than 3 times per week or no reported activity at all; 62.4 percent of men and 66.4 percent of women were found to have sedentary life-styles. A sedentary life-style is believed to be a risk factor for heart diseases, which happens to be the leading cause of death among adults in Indiana as well as in the United States.

OBESITY

Obesity is defined as being 120 percent or more of "ideal" weight as established by the 1959 Metropolitian Insurance Height and Weight Tables.

Based on this definition, approximately 26.7 percent of women and 28.6 percent of men over 18 years of age were categorized as obese in the year 1985. Obesity has been noted to increase the risk of adult onset diabetes, high blood pressure, heart diseases, cancer, etc.

SMOKING

Currently, 32.2 percent of the Indiana adult population smokes; 36.8 percent of men and 27.9 percent of women smoke. Smoking is a risk factor for heart disease, cancer, stroke, diseases of arteries, accidents other than motor vehicle accidents, and other chronic obstructive pulmonary disease (COPD). These six causes accounted for 36,189 deaths (77.5 percent of all deaths) for individuals over 18 years of age in 1985.

ALCOHOL CONSUMPTION

Two types of alcohol consumption behaviors were surveyed: acute and chronic. Acute drinking is defined as consuming 5 or more drinks per occasion one or more times in the past month. About 19.3 percent of Indiana's adult population were estimated to engage in acute drinking based on the above definition. Chronic drinking, on the other hand, is defined as consuming 60 or more drinks per month; 4.9 percent of adult Hoosiers fell in this category in the 1985 survey.

This behavior is still very sex-specific in that 31.0 percent of men were acute drinkers and 8.6 percent of men were chronic drinkers compared to only 8.7 percent of women being acute drinkers and 1.6 percent being chronic drinkers. Some of the acute drinkers were chronic drinkers as well. Acute and chronic drinking is associated with motor vehicle accidents, suicide, homicide, and a variety of other health problems.

The following table shows the five leading risk factors for each age group and the five leading causes of death for the same age group in the year 1985. The death rates are age-specific per 100,000 population.

Table A. INDIANA, 1985 LEADING RISK FACTORS AND LEADING CAUSES OF DEATH BY AGE

ALL AGES 18+

Health Risk	Number at Risk	% of Population	Leading Causes of Death	Number	Rate
1. Lack of seat-belt use	2,679,000	69.2	1. Heart Disease	17,729	444.3

INDIANA, 1985

Table 1. RESIDENT VITAL STATISTICS SUMMARY

Notes:

*Rates:

Births, Marriages and Total Births	- per	1,000 population
Deaths from Specific Causes	- per	100,000 population
Stillbirths and Infant Deaths	- per	1,000 live births
Abortions	- per	1,000 live births
Maternal (Part A)	- per	100,000 live births
Fertility Rates: Births	- per	1,000 females 15-44

Total Fertility Rate: The number of births 1,000 females would have in a lifetime if the fertility experience of 1985 prevailed. Calculated by taking the fertility rate for each five-year age group 15 through 44 (15-19, 20-24, etc.), adding, then multiplying by 5 (since each female would have five years experience in each age group). A total fertility rate of approximately 2100 is necessary to maintain the population on a permanent basis.

**Includes deaths listed in younger age groups

Estimated Population, Indiana, July 1, 1985 5,499,100

A. Births, Deaths, Stillbirths, Marriages and Rates

	Number	Rate*
Births	80,928	14.7

INDIANA, 1985

Table 3. ESTIMATED POPULATION* AND RESIDENT LIVE BIRTHS, DEATHS, STILLBIRTHS AND RATES, FOR EACH HEALTH SERVICE AREA, EACH COUNTY AND EACH CITY OVER 5,000 IN 1980 CENSUS

RATES:

Birth and Death Rates per 1,000 Population
Stillbirths ratio per 1,000 Live Births

*Because of rounding, county population figures do not add to State total.

INDIANA, 1985

Table 5. RESIDENT TOTAL BIRTHS, LIVE BIRTHS, MATERNAL, INFANT, NEONATAL AND PERINATAL DEATHS AND DEATH RATES FOR EACH HEALTH SERVICE AREA, EACH COUNTY AND EACH CITY OVER 5,000 IN 1980 CENSUS

NOTES:

Total Births	Live births plus stillbirths
Maternal Death Rate	per 100,000 live births
Infant Deaths	Deaths under one year
Infant Death Rate	per 1,000 live births
Neonatal Deaths	Deaths under one month
Neonatal Death Rate	per 1,000 live births
Perinatal Deaths	Deaths under one month plus stillbirths
Perinatal Death Rate	per 1,000 live births
